Large Fragment System

Indications

- The Large Fragment System is indicated for internal fixation of fractures of the humerus, femur and tibia. It may also be used in revision surgery of pseudoarthrosis, non-union and mal-union. Osteotomies, arthrodesis and ligament reattachment may also be performed using these implants with the applicable operative technique.

Features & Benefits

- Anatomically pre-contoured plate design
- Reduced plate thickness in the periarticular region
- Rounded and tapered plate ends
- K-wire or suture holes for temporary plate fixation
- Allows cortical screws to be placed in either compression or neutral position, depending on whether inter-fragmentary compression is desired.
- In LC-DCP plate, the grooved undersurface provides limited contact between plate and bone, which also allows for periosteal callus formation at the fractures site

Implants

Supracondylar Support Plates
